

“TOTAL POWER CUSTOM CLEAN” PROCESS

HERE ARE THE ISSUES !

We clean to protect our health ! When people STOP cleaning, it affects ALL family members health !

Why do we clean our homes? We clean to extract and remove contaminants, particles of dust, dirt, food and moisture that exists in our homes from our lifestyles, as well as what we, our children, friends and animals bring into the home by normal trafficking. It is because of these interactions that cleaning has become a major time consuming task that must be maintained in order to assure the continuation of a healthy homelife.

But it just doesn't stop there. As technology has evolved, we arm ourselves with an arsenal of cleaning products for the various surfaces, fixtures, walls and floorings that makes up our homes. Though the contents and warning labels continue to educate us to the dangers of over usage, combinations with other solutions as well as safety use and storage tips; these solutions “compound” the essence of what we try to accomplish by regular cleaning.

Almost every cleaning supply you store in your home has agent(s) that contribute to an unhealthy indoor living environment including VOC's (Volatile Organic Compounds) and poisonous, reactive or flammable qualities that are very dangerous if not handled correctly. But it just doesn't stop there. This technology is also used outdoors which is brought into the home. The most common are the fertilizers and insecticides that are used in gardens, shrubs, plants and lawn. These compounds are acids and base compounds that affect the home's indoor air, furniture, personal possessions, walls and floorings.

DID YOU KNOW?

- The average home in the United States accumulates almost FORTY POUNDS of dust & dirt annually (Imagine EIGHT 5 pound bags of sugar sitting on your kitchen floor !)
- This average home has approximately 2 MILLION dust mites;
- The cleaning industry uses and sells over 6 BILLION POUNDS of chemicals annually;
- We spent nearly 70% of our time indoors;
- Our children spend nearly 90% of their time indoors;
- Indoor air in our homes is 3-5 times WORSE than outdoor air;
- Since 1990, there has been a 160% increase in diagnosed and treated asthma conditions in children under age 5 affecting over 4.8 million children;
- Over 14 million “sick-days” were logged by our children's school systems;
- Children now have a significant increase in diagnosed cases of cancer by exposure or consuming cleaning solutions ~~ 8500 in 2003. This exposure has caused increases in learning disabilities as well.

HELP IS ON THE WAY AND HERE !

- The US government recently addressed this concern by the passage of Executive Order 13101 which is the foundation of the “Green Seal – GS 37” environmentally safe and PH balanced products which are necessary in our lives and whose affects have a reduced impact on us and our natural resources;
- Hepa filter and dustless filtration personal vacuum systems are entering the home residence marketplace;
- The identification and removal of lead based paints, improved school building standards and air quality has caused a 49% increase in math skills and 27% increase in reading skills from 1996-2000;
- OSHA rules and regulations for commercially approved cleaning products are starting to be available to the residential cleaning market;
- The introduction of MICROFIBER chemical solution-free cloths improves cleaning efficiency while decreasing the use of cleaning supplies.

We all understand that one system; cleaning product/solution or process CANNOT create the “answer” to improving your home health quality.

The payout is that you and your family is that EVERY VISIT by ProTime Services' 2 Person Team WILL make a difference !
